ъ

Symbolic sequence: 000...0

э

- for an initial  $\mathbf{x}_0$ , the trajectory  $\{\mathbf{x}_i\}_{i=-n}^n$  visits the partition elements  $B_{\mathbf{x}_i}$
- for a generating partition the intersection of all images and pre-images in the limit  $n \to \infty$  is a single point:  $\bigcap_{i=-n}^{n} \mathbf{f}^{(-i)}(B_{\mathbf{x}_i})$

[VM Alekseev and MV Yakobson, Physics Reports 75, 290 (1981)]

### Back to dialanine

Time scales of the transitions: 0.25 ns

Problem: none of the molecular properties exhibit this long time scale.

▲□▶ ▲□▶ ▲□▶ ▲□▶ = 三 のへぐ

#### Partition the $\psi$ - $\phi$ map

Divide the A basin into  $3^8 = 19683$  parts  $\overleftarrow{s}_i \equiv \{\dots s_{i-2}s_{i-1}s_i\}$ For each part analyse the statistic  $P(s_{i+1}|\overleftarrow{s}_i)$ 

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

### Partition the $\psi$ - $\phi$ map

For the first few hundred picoseconds the probabilities for all parts are the same.

Then, some start deviating from the rest. By the end of the  $1\mu$  simulation  $\approx 5\%$  of the trajectories are different from the rest and between each other.

The number of these different trajectories grows logarithmically.

- ロ ト - 4 目 ト - 4 目 ト - 4 目 - 9 へ ()

### Consequences of slowly changing $P(s_{i+1}| \overleftarrow{s}_i)$

The number of special trajectories for original time series (black), and two simulated time series of stationary (blue) and non-stationary (red) Markov chain models

・ロト ・ 一下・ ・ ヨト・

### Consequences of slowly changing $P(s_{i+1}| \overleftarrow{s}_i)$

The number of special trajectories for original time series (black), and two simulated time series of stationary (blue) and non-stationary (red) Markov chain models

P(0) = P(1) = P(2) = 1/3;  $P(00) = P(10) = \dots = 1/9;$  $P(0|00) \neq P(0|10)$  Different projections:  $\psi - \phi$ , coordinates or velocities of different atoms of the peptide, give the same grows of the number of these special trajectories.

Physical meaning: because the trajectories passing through the areas 'cut out' by symbolisation are influenced by the other degrees of freedom, the neighbouring atoms.

- ロ ト - 4 日 ト - 4 日 ト - 4 日 ト - 4 日 ト - 4 日 ト

This rate of appearance of the special trajectories is *the same for dialanine and water*!

### The special trajectories for a 21-residue peptide

Figure: The A5(A3RA)3A molecule

◆□▶ ◆□▶ ◆三▶ ◆三▶ ◆□ ◆ ○ ◆

### The special trajectories for the 21-residue peptide

500 Image: A marked black

### Conclusion

- Water drives the conformational changes in peptides (proteins).

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

- There is a *very slowly changing* process(s) in water that is collective and related to conformational transitions.
